

### Description:

pLAS2.1w.Pbsd-L-tRFP-C was derived from pLKO-AS1009 by replacing U6p and stuffer sequences with CMVp from pAS2.1w series plasmid. As a result, cells transduced with this virus would be able to express tRFP-C and blasticidin selection marker at the same time.

### Location of Features (for other features, please refer to pLKO.1):

- CMV promoter : nt234-802
- Multiple cloning sites: nt880-950
- PGK promoter transcription cassette: nt1159-2792
- WPRE sequence: 2808-3396

### Note:

1. Since lentiviral transfer vector may undergo sequence re-arrangement and/or deletion when its ligated products were transformed into DH5 $\alpha$  competent cells; to avoid that, Stbl3 (Invitrogen) is recommended for transformation.
2. If plasmid-transformed Stbl3 cells grow slowly, try to transform it into HB101 or GM2163 *E. coli* strain for large-prep.
3. Xba I (\*) site is blocked by overlapping dam methylation.
